# Study on the Load Sharing Mechanism of Main Girders in a Temporary Bridge with End-Plate Connections

# Evaluation of Structural Details of End-Plate Connections on Load Capacity and Redistribution in Temporary Bridges

## BACKGROUND

- The demand for temporary bridges with end-plate connections has been increasing due to disaster recovery and the replacement of aging bridge infrastructure. (Fig.1)
- While end-plate connections offer simplicity and reusability, the effect of bolt yield on load-bearing capacity and load redistribution mechanisms remains unclear.
- Understanding residual *load-bearing capacity* beyond the service limit state is crucial for safe design and maintenance.

### SUMMARY

#### Temporary bridges with end-plate connections possess inherent structural redundancy.

Fig.5 illustrated structural redundancy, showing that after partial bolt yielding, loads were redistributed from the G2 girder to the adjacent G1 and G3 girders.

Post-vielding, Fig.6 showed reduced stiffness and plastic deformation in the load-deflection response, indicating nonlinear behavior.

As Fig.7, plastic zones extended from G2 to neighboring girders through cross beams and deck slabs, highlighting structural cooperation.

Even under severe yield (Case- $2 \times 6$ ), RF evaluations confirmed sufficient residual capacity except in the most critical case, affirming the reliability of the design.(Formula.1, Table.1)

365 335	Table. 1 RF Calculation Result in Each Case					
304 274 243 213	Case	Condition Factor¢c	Ultimate Strength R(kN)	RF Value	Evaluation	
182 152	Full	1	5646	1.38	Safe	
91 61	$2 \times 2$	0.95	5275	1.22	Safe	
30 0	2×4	0.9	5121	1.11	Nearly Safe	
	2×6	0.85	4756	0.96	Slightly Dangerou	

Rating Factor (RF) was calculated using the following.  $RF = \frac{\phi_s \phi_c R - \gamma_D D}{\gamma_s L}$  Formula. 1

End-plate connected temporary bridges maintain load-bearing capacity even under bolt yield due to load redistribution mechanisms involving cross beams and deck slabs. Residual capacity evaluation using Rating Factor (RF) indicates sufficient safety margin except in severe yield cases (Case- $2 \times 6$ ).
