

Research Plan

Michio Yoshiwaki

(I) A study of applications to Topological data analysis(=TDA).

I work on an extension of persistent homology to multiparametric data, which was already written in ‘Abstract of the results of my research’. Namely, I will study the subject of the representation theory of multidimensional persistence modules.

(I)-1: First, I would like to make a further investigation of our result [11], [13], [15] on multidimensional persistence modules, such as an extension of the theory, to complete an algorithm.

(I)-2: Second, I will study an extension of a robustness of persistent homologies for noises to multidimensional persistence modules. For the 1-dimensional version, refer to [12]. Note that the robustness is one of the foundations of TDA and is need to be the practical realization of multidimensional persistence modules.

(II) The others.

In addition, I try to find an interaction among theory of persistence modules, representation theory, and combinatorics.
